Contents: Major Tasks in Data Preprocessing

- Data Cleaning
- Data Integration
- Data Reduction
- Data Transformation and Data Discretization

Why Pre-process the Data?

A multidimensional view

- Accuracy: your data mining/machine learning results are not accurate, despite multiple trials...
- Completeness: not recorded, unavailable, ...
- □ **Consistency**: some modified but some not,
- □ **Timeliness**: timely updated? →
- Believability: how trustable the data are?
- Interpretability: how easily the data can be understood?

preprocessing of Test 99

Overview

Data cleaning

- dinty sen Mg 7
- □ Fill in missing values, smooth noisy data, identify or remove outliers, and resolve inconsistencies
- Data integration

- Scorter SIOT 25 intargrate
- Integration of multiple databases, data cubes, or files
- Data reduction
 - Dimensionality reduction
 - Numerosity reduction
 - Data compression

- eryCHS data &
- Data transformation and data discretization
 - Normalization
 - Concept hierarchy generation

Data Cleaning

- Data in the Real World Is Dirty: Lots of potentially incorrect data, e.g., instrument faulty, human or computer error, transmission error
 - incomplete: lacking feature values, lacking certain features of interest, or containing only aggregate data
 - e.g., Occupation= " " (missing data) ກໍໄຮເຄື່ອງ ທາໃນຄ
 - noisy: containing noise, errors, or outliers
 - e.g., *Salary*= "−10" (an error)
 - inconsistent: containing discrepancies in codes or names, e.g.,
 - Age= "42", Birthday= "03/07/2000" In chistothe
 - In some DBs, rating is "1, 2, 3", but some other DBS, "A, B, C"
 - discrepancy between duplicate records

Missing Data

Missing Valuez ignote
au

- □ **Remove the object:** usually done when class label is missing—not effective when the % of missing values is large
- □ Fill in the missing value manually: might be accurate, but

tedious + infeasible

- □ Fill in it automatically with
 - a simple constant (default value, or "unknown")
 - □ the feature mean
 - □ the feature mean for all samples belonging to the same group (e.g., same class, same cluster, etc...)
 - □ the inferred value: such as based on some regression or classification model

rature 2 to 22 2

Noisy & Inconsistent Data

- □ **Noise:** random error or variance in a measured feature
 - Mainly due to faulty data collection instruments
 - Noisy data is often expressed as an outlier
 - Outlier detection -> delete outliers -> find missing values
 - □ Thus we can apply an **outlier detection** method (will learn it

```

- □ *Age*= "42" , but *Birthday*= "03/07/2000"
- □ For a duplicate records, one name is "cm" but the other is "inch" | group & day ____ Convert Eas. (nch) cm
- - Computer performs outlier detection, then human will inspect it

Contents

- Data Preprocessing: An Overview
 - Data Quality
 - Major Tasks in Data Preprocessing
- Data Cleaning
- Data Integration

- Data Reduction
- Data Transformation and Data Discretization
- Summary

Data Integration

- **□** Data integration:
 - Combines multiple datasets from multiple sources into a coherent store
- **Schema integration: e.g., A.cust-id ≡ B.cust-#**
 - Integrate metadata from different sources

Meaning of they

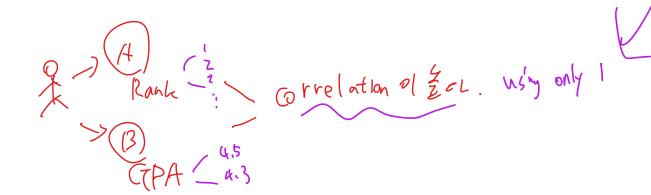

- □ For the same real world entity, feature values from different sources are different
- e.g., cm vs. inch, meter vs. mile

Holled mile Bolled KM Olygo Conflict

Handling Redundancy in Data Integration

- Redundant data occur often when integration of multiple databases
 - □ Derivable data: One feature may be a "derived" feature in another table, e.g., birthdate vs. age นูปแกปกก่ะ 資意のは利け ない。
- Redundant features can be automatically detected by correlation analysis and covariance analysis
- Reducing/avoiding redundancies and inconsistencies improves mining speed and quality

Correlation Analysis (Nominal Features)

We want to know that "like_science_fiction" and "play chess" are correlated

		Play chess()Not play chess(N	Sum (row)			
	Like science fiction (Y)	250(90)	200(360)	450 1:4			
	Not like science fiction)50(210) vgh	<mark>:/</mark> 1000(840)	1050 1:4	्रेट हैं। सुरु		
	Sum(col.)	300	1200	1500 :4			
independent ELTH							
NY (C	ni-square) test	each ce	_{II} Expected	d	9 > correlated		

- □ The larger the X² value, the more likely the features are corelated
- □ The cells that contribute the most to the X² value are those whose actual count is very different from the expected count
- Expected value is estimated under the independence assumption

Correlation Analysis (Nominal Features)

	Play chess	Not play chess	Sum (row)
Like science fiction	250(90)	200(360)	450
Not like science fiction	50(210)	1000(840)	1050
Sum(col.)	300	1200	1500

□X² (chi-square) calculation

In parenthesis are expected counts calculated based on the data distribution in the two categories

$$\chi^2 = \frac{(250 - 90)^2}{90} + \frac{(50 - 210)^2}{210} + \frac{(200 - 360)^2}{360} + \frac{(1000 - 840)^2}{840} = 507.93$$

It shows that like_science_fiction and play_chess are correlated in the group

Correlation Analysis (Numeric Features)

Correlation coefficient (also called Pearson's correlation coefficient, PCC) among features A and B:

$$r_{A,B} = \frac{\sum_{i=1}^{n} (a_i - \overline{A})(b_i - \overline{B})}{(n-1)\sigma_A \sigma_B} = \frac{\sum_{i=1}^{n} (a_i b_i) - n\overline{A}\overline{B}}{(n-1)\sigma_A \sigma_B}$$

n is the number of data, B and A are the respective means of A and B, σ_A and σ_B are the respective standard deviation of A and B, and $\Sigma(a_ib_i)$ is the sum of the AB cross-product.

 \Box If $r_{A,B} > 0$: A and B are positively correlated

A) Langue 65 tand to be in creased

- □ A's values increase as B's). The higher, the stronger correlation
- = r_{A,B} = 0: independent completely independent
- $\Box \mathbf{r}_{AB} < \mathbf{0}$: negatively correlated

Visually Evaluating Correlation

Scatter plots showing the correlation from -1 to 1.

Correlation(상관관계) does not imply causality(인과관계)

=> "# of hospitals" and "# of car-theft" in a city are correlated. However, both may be causally linked to another feature: population

Covariance (Numeric Features)

Covariance is similar to correlation

$$Cov(A, B) = E((A - \bar{A})(B - \bar{B})) = \frac{\sum_{i=1}^{n} (a_i - \bar{A})(b_i - \bar{B})}{n}$$

Correlation coefficient:
$$r_{A,B} = \frac{Cov(A,B)}{\sigma_A \sigma_B}$$

where n is the number of data, \overline{A} and \overline{B} are the respective mean or expected values of A and B, σ_A and σ_B are the respective standard deviation of A and B.

- □ **Positive covariance:** If $Cov_{A,B} > 0$, then A and B both tend to be larger than their expected values.
- □ **Negative covariance:** If Cov_{A,B} < 0 then if A is larger than its expected value, B is likely to be smaller than its expected value.
- □ Independence: $Cov_{A,B} = 0$

Covariance: An Example

$$Cov(A, B) = E((A - \bar{A})(B - \bar{B})) = \frac{\sum_{i=1}^{n} (a_i - \bar{A})(b_i - \bar{B})}{n}$$

It can be simplified in computation as

$$Cov(A, B) = E(A \cdot B) - \bar{A}\bar{B}$$

- □ Suppose two stocks A and B have the following values in one week: (2, 5), (3, 8), (5, 10), (4, 11), (6, 14).
- Question: If the stocks are affected by the same industry trends, will their prices rise or fall together?

$$\Box$$
 E(A) = $(2 + 3 + 5 + 4 + 6)/5 = 20/5 = 4$

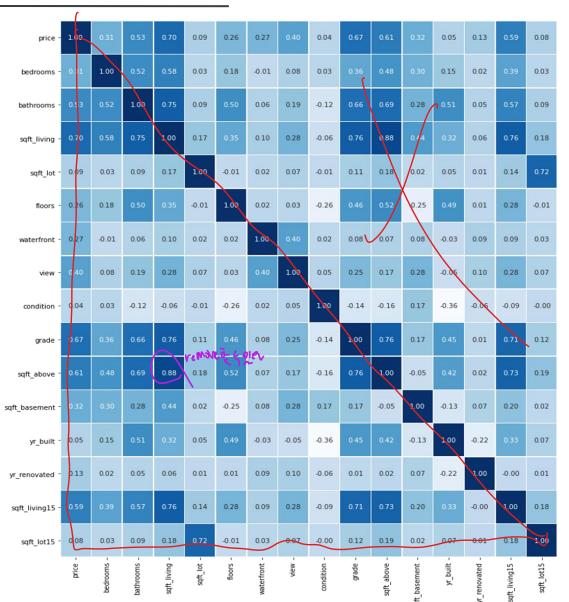

$$\Box$$
 E(B) = (5 + 8 + 10 + 11 + 14) /5 = 48/5 = 9.6

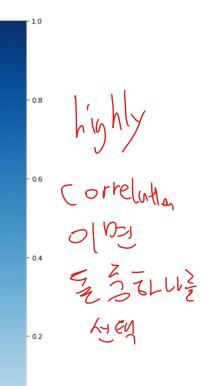

$$\square$$
 Cov(A,B) = $(2 \times 5 + 3 \times 8 + 5 \times 10 + 4 \times 11 + 6 \times 14)/5 - 4 \times 9.6 = 4$

□ Thus, A and B rise together since Cov(A, B) > 0.
